Polink-2 HRP Plus Broad DAB Detection System for Immunohistochemistry

(2-step Polymer-HRP detection system for mouse and rabbit, biotin-free,)
Polymer Detection System with Super Sensitivity and Specificity

Intended Use:
Polink-2 Plus HRP Broad Detection Kit is the 3rd generation of our polymer detection systems. It uses rabbit and mouse antibody enhancer to help amplify the polymer-enzyme conjugate reaction to achieve superior sensitivity and specificity in immunohistochemistry staining. It produces consistent immunostaining outcomes on archival tissues and on difficult-to-work with antibodies. User may need to further dilute primary antibody due to super sensitivity of Polink-2 Plus detection system. It is a biotin-free system, therefore, it overcomes the non-specific staining caused by streptavidin/biotin system due to endogenous biotin. Most commonly used specimens for this system are: frozen tissue, paraffin-embedded tissue, freshly prepared lymphocytes and fixed culture cells. It can be used for manual stain or autostainer. Staining conditions need to be optimized by user.

Polink-2 Plus HRP Detection System offers a wide choice for primary antibodies, including broad spectrum (for mouse and rabbit primary antibodies), mouse, rabbit, goat, and rat primary antibodies. Refer to Related Product section for details.

Recommended Protocol:

1. Fixation: To ensure the quality of the staining and obtain reproducible performance, user needs to supply appropriately fixed tissue and well prepared slides.
2. Tissue need to be adhered to the slide tightly to avoid tissue falling off.
3. Paraffin embedded section must be deparaffinized with xylene and rehydrated with a graded series of ethanol before staining.
4. Cell smear samples should be made into as thin monolayer as possible to obtain satisfactory results.
5. Investigator needs to optimize dilution and incubation times for primary antibodies.
6. Three control slides will aid the interpretation of the result: positive tissue control, reagent control (slides treated with Isotype control reagent), and negative control.
7. Staining steps: DO NOT let specimen or tissue dry from this point on.

</tr>
</tbody>
</table>

Storage: 4-8°C
4. PRIMARY ANTIBODY
Supplied by user
a. Apply 2 drops (100 μl) or enough volume of PRIMARY ANTIBODY to cover the tissue section completely. Incubate in moist chamber for 30-60 min.

b. Rinse with PBS 3 times for 2 minutes each.

5. Broad (Rabbit and Mouse) Antibody Enhancer (Ready-to-use).
Reagent 1
a. Apply 2 drops (100 μl) or enough volume of Broad Antibody Enhancer to cover each section. Incubate in moist chamber for 10 min.

b. Rinse with PBS 3 times for 2 minutes each.

6. POLYMER-HRP for Rabbit and Mouse antibody (Ready-to-use)
Reagent 2
a. Apply 2 drops (100 μl) or enough volume of POLYMER-HRP for RABBIT and Mouse Antibody to cover each section. Incubate in moist chamber for 10 min.

b. Rinse with PBS for 2 min, 3 times.

7. CHROMOGEN
Reagent 3A: DAB Substrate
Reagent 3B: DAB Chromogen
a. Add 1 drop or 2 drops (for higher sensitivity and contrast) of Reagent 3B into 1ml of reagent 3A. Mix well. Protect from light and use within 5 hours.

b. Apply 2 drops (100 μl) or enough to completely cover tissue, of pre-mixed DAB to each section. Incubate for about 5 min. Monitor the color development under microscope.

c. Rinse with tap water for 1-2 min.

8. HEMATOXYLIN
Supplied by user
a. Counterstain with 2 drops (100 ul) or enough volume of Hematoxylin to cover tissue completely and wait about 15-20 seconds.

b. Rinse well under tap water for 1-2 minutes.

c. Put slides in PBS until showing blue color (about 30-60 seconds).

d. Rinse well in distill or tap water.

9. Mounting medium:
Supplied by user
Follow the manufacture data sheet procedure for mounting.

Recommended product:
2. O-Mount: Cat. No. E02-18 (18ml), for DAB and BCIP/NBT
3. Simpo-Mount: Cat.No. E03-18 (18ml), or E03-100 (100ml), universal permanent mounting medium. Can be used with or without cover slip

Refer to insert

Protocol Notes:

1. The fixation, tissue slide thickness, and primary antibody dilution and incubation time affect results significantly. Investigator needs to consider all factors and determine optimal conditions when interpreting the result.

2. Pre-antibody blocking is optional and can be omitted if primary antibodies are diluted in buffers containing 2-10% normal goat serum.
