Background:	CD79 is a 23/21 disulfide-linked heterodimer composed of an alpha chain (CD79a/mb-1) and a beta chain (CD79b/B29). CD79b is the B cell antigen receptor Ig beta chain (BCR Ig beta), which associates with B cell antigen receptor Ig alpha chain to form a functional heterodimer that interacts with membrane immunoglobulin (mIg). The mIgM component binds antigen and the Ig alpha/Ig beta heterodimer transduces signals. CD79 beta is a B cell specific marker, valuable for the detection of B cells at all maturation stages.
Synonyms:	B29, IGB, B-Cell marker
