Background:

FABP1 (Fatty acid binding protein1) encodes the fatty acid binding protein found in liver. FABP1 is composed of ten antiparallel β strands that form a barrel with a bigger binding pocket than the other FABPs allowing it to accommodate two fatty acid. This protein binds free fatty acids and their coenzyme A derivatives, bilirubin, and some other small molecules in the cytoplasm; it may be involved in intracellular lipid transport and metabolism.

Synonyms:

FABPL, L-FABP, Liver-type fatty acid-binding protein

Protein Pathways:

PPAR signaling pathway

Western blot analysis on HepG2 cells: Cell lysates of HepG2 (30 μ g) were resolved by SDS-PAGE, transferred to NC membrane and probed with anti-Human FABP1 (1/1000). Proteins were visualized using a goat anti-mouse secondary antibody conjugated to HRP and an ECL detection system.

Immunohistochemistry: -N FABP1 antibody staining of Formalin-Fixed, Paraffin-Embedded Human Kidney at 5 μ g/ml followed by biotinylated anti-mouse IgG secondary antibody, alkaline phosphatase-streptavidin and chromogen.

Immunohistochemistry: -N FABP1 antibody staining of Formalin-Fixed, Paraffin-Embedded Human Liver at 5 ug/ml followed by biotinylated anti-mouse IgG secondary antibody, alkaline phosphatase-streptavidin and chromogen.

Immunohistochemistry: -N FABP1 antibody staining of Formalin-Fixed, Paraffin-Embedded Human Colon Cancer Tissue at 1/1000 for 2 hours at room temperature. Antigen retrieval was performed in 0.1M sodium citrate buffer and detected using Diaminobenzidine (DAB).
