## Product datasheet for AM09231PU-N

## Mycobacterium tuberculosis (38 kDa Ag) Mouse Monoclonal Antibody [Clone ID: A2H8]

## **Product data:**

| Product Type:          | Primary Antibodies   |
|------------------------|--|
| Clone Name:            | A2H8   |
| Applications:          | ELISA, WB  |
| Recommended Dilution:  | <ul> <li>ELISA: Reactive to the immunogen in ELISA assay.</li> <li>The monoclonal antibody reacts with the recombinant <i>M. tuberculosis</i> (TB) protein in ELISA assay.</li> <li>Western Blotting: The monoclonal antibody detects the recombinant <i>M. tuberculosis</i> (TB) protein on Western blot. A band corresponding to the immunogen is detected.</li> </ul> |
| Reactivity:            | Mycobacterium tuberculosis   |
| Host:                  | Mouse  |
| lsotype:               | lgG1   |
| Clonality:             | Monoclonal   |
| Immunogen:             | A recombinant M. tuberculosis protein cloned from virulent strain H37Rv with primers targeting the 38Kd antigen.   |
| Specificity:           | This <i>M. tuberculosis</i> antibody is reactive with the recombinant immunogen (M. tuberculosis 38Kd antigen).<br>Reactivity with the native 38KD antigen in TB H37Rv has not been tested.  |
| Formulation:           | 0.01M PBS, pH 7.0 without preservatives<br>State: Aff - Purified<br>State: Lyophilized purified IgG fraction   |
| Reconstitution Method: | Restore with Double distillated water to adjust the final concentration to 1.0 mg/ml.  |
| Purification:          | Affinity Chromatography on Protein G   |
| Conjugation:           | Unconjugated   |
| Storage:               | Upon receipt, store undiluted (in aliquots) at -20°C.<br>Avoid repeated freezing and thawing.  |
| Stability:             | Shelf life: one year from despatch.  |

|             | Mycobacterium tuberculosis (38 kDa Ag) Mouse Monoclonal Antibody [Clone ID: A2H8] –<br>AM09231PU-N  |
|-------------|---|
| Background: | Mycobacterium tuberculosis is the most common cause of tuberculosis. Primary infection<br>begins with inhalation of 1 to 10 aerosolised bacilli. The pathogenicity of the organism is<br>determined by its ability to escape host immune responses as well as eliciting delayed<br>hypersensitivity. Alveolar macrophages engulf the invading cells but are unable to mount an<br>effective defense. Several virulence factors are responsible for this apparent failure; most<br>notably in the mycobacterial cell wall are the cord factor, lipoarabinomannan, and the 65 kd<br>heat shock protein or HSP65.<br>The emergence of new strains of resistant Mycobacterium tuberculosis has created new<br>interest in clinical diagnosis. Studies have shown immunohistochemical techniques to be<br>superior to conventional special stains. Thus the demonstration of mycobacterial antigens are<br>not only useful in establishing mycobacterial aetiology, but can also be used as an alternative<br>method to the conventional Ziehl-Neelsen method. |
| Synonyms:   | M. tuberculosis, TB   |
