| Specificity:          | Recognizes a polypeptide which is identified as insulin, a 51-amino acid polypeptide<br>composed of A and B chains connected through the C-peptide. Proinsulin, which has very<br>little biological activity, is cleaved by proteases within its cell of origin into the insulin molecule<br>and the C-terminal basic residue. Insulin enhances membrane transport of glucose, amino<br>acids, and certain ions. It also promotes glycogen storage, formation of triglycerides, and<br>synthesis of proteins and nucleic acids. Deficiency of insulin results in diabetes mellitus. The<br>main storage site for insulin is the pancreatic islets. Antibodies to insulin are important as<br>beta-cell and insulinoma marker. |

*Cellular Localization*: Cytoplasmic.
