GRIGENE Frizzled 8 (FZD8) Rabbit Polyclonal Antibody – AP01267PU-M

Background:The frizzled gene, originally identified in Drosophila melanogaster, is involved in the
development of tissue polarity. The mammalian homolog of frizzled, as well as several
secreted mammalian frizzled-related proteins (FRPs), have been described. The frizzled
proteins contain seven transmembrane domains, a cysteine-rich domain in the extracellular
region and a carboxy-terminal Ser/Thr-xxx-Val motif. They function as receptors for Wnt and
are generally coupled to G proteins. The cysteine-rich domain of frizzled-8 blocks
endogenous Wnts and the effects of Wnt-1 and Wnt-5 on proliferation. The mouse frizzled-8
gene, which encodes a Wnt receptor, is a potent cancer-associated activator of the β-catenin-
TCF pathway. The frizzled-8 gene contains no introns. Frizzled-8 mRNA has been detected in
fetal brain and kidney, and also in adult pancreas, skeletal muscle, kidney and heart. Frizzled
is highly expressed in HeLa S3 (cervical uterus cancer) cells and A549 lung cancer cells.
