Background:

STAT1 and STAT2 are induced by IFN alpha and form 1, a heterodimer which is part of the ISGF transcription factor complex. The STAT3 protein is expressed in most cell types and is activated by multiple cytokines and growth factors including: IFN α , IL10, IL6, IL11, IL12, IL2, EGF, among others. STAT3 beta appears to be activated by both EGF and IL6, but STAT3 alpha is only activated by EGF. STAT3 binds to DNA as either a homodimer or as a heterodimer with STAT1. STAT3 interacts with the APRE (acute phase response element) and SIE (cis-inducible element). STAT4, predominantly expressed in testis and myeloid cells, is activated by IL12. STAT5 is activated by prolactin and IL3. STAT6 participates in signaling pathways mediated by IL4.

Synonyms:

STAT-3, Acute-phase response factor, APRF
