Cofilin 1 (CFL1) pSer3 Rabbit Polyclonal Antibody

Product data:

Product Type: Primary Antibodies

Applications: IF, IHC, WB

Recommended Dilution: Western blot: 1/500-1/1000.

Incubate membrane with diluted antibody in 5% nonfat milk, 1xTBS, 0.1% Tween-20 at 4°C

with gentle shaking overnight. **Immunofluorescence:** 1/100-1/200.

Immunohistochemistry on Paraffin Sections: 1/50-1/100.

Reactivity: Human, Mouse, Rat

Host: Rabbit
Clonality: Polyclonal

Immunogen: The antiserum was produced against synthesized phosphopeptide derived from Human

Cofilin around the phosphorylation site of serine 3 (M-A-Sp-G-V).

Specificity: This antibody detects endogenous levels of Cofilin only when phosphorylated at Serine 3.

Formulation: PBS (without Mg2+ and Ca2+), pH 7.4, 150 mM NaCl, 0.02% Sodium Azide and 50% Glycerol.

State: Aff - Purified

State: Liquid purified Ig fraction.

Concentration: lot specific

Purification: Affinity Chromatography using epitope-specific phosphopeptide. The antibody against non-

phosphopeptide was removed by chromatography using non-phosphopeptide corresponding

to the phosphorylation site.

Conjugation: Unconjugated

Storage: Store the antibody (in aliquots) at -20°C.

Avoid repeated freezing and thawing.

Stability: Shelf life: One year from despatch.

Gene Name: cofilin 1

Database Link: Entrez Gene 1072 Human

P23528

Background:

Cofilin is a small phosphoinositide sensitive, actin binding protein capable of depolymerizing actin filaments in vitro. Under certain conditions, it fragments the filaments and accelerates actin subunit dissociation from their 'pointed' (minus) ends. Cofilin binds stoichiometrically to monomeric G-actin and to actin protomers in filaments in an apparent pH-dependent, Ca2+independent manner. Cofilin intercalates between longitudinally associated actin monomers within the filament and distorts its helical twist. Cofilin is ubiquitous in tissues of eukaryotes and is especially abundant in neuronal tissues. It is essential for viability and is important for many cellular processes involving actin remodeling such as motility at the leading edge of cells, polarized cell growth, endocytosis, phagocytosis, cellular activation, cytokinesis, and pathogen intracellular motility.

Synonyms: CFL1, CFL, p18

Note: Molecular Weight: 19 kDa
