Chk1 (CHEK1) Rabbit Polyclonal Antibody – AP06050PU-M

Background:Cell cycle events are regulated by the sequential activation and deactivation of cyclin
dependent kinases (Cdks) and by proteolysis of cyclins. Chk1 and Chk2 are involved in these
processes as regulators of Cdks. Chk1 and Chk2 both function as essential components in the
G2 DNA damage checkpoint by phosphorylating Cdc25C in response to DNA damage.
Phosphorylation inhibits Cdc25C activity, thereby blocking mitosis. Cdc25A, Cdc25B and
Cdc25C protein tyrosine phosphatases function as mitotic activators by dephosphorylating
Cdc2 p34 on regulatory tyrosine residues. It has also been shown that Chk1 can
phosphorylate Wee1 in vitro, providing evidence that the hyperphosphorylated form of
Wee1, seen in cells delayed by Chk1 overexpression, is due to phosphorylation by Chk1.

Synonyms: CHEK1, CHEK-1
