Claudin 1 (CLDN1) Rabbit Polyclonal Antibody – AP06060PU-N

Background:The claudin superfamily consists of many structurally related proteins in humans. These
proteins are important structural and functional components of tight junctions in paracellular
transport. Claudins are located in both epithelial and endothelial cells in all tight junction-
bearing tissues. Three classes of proteins are known to localize to tight junctions, including
the claudins, Occludin and junction adhesion molecule (JAM). Claudins, which consist of four
transmembrane domains and two extracellular loops, make up tigh junction strands.
Emerging evidence suggests that the claudin family of proteins regulates transport through
tight junctions via differential discrimination for solute size and charge. Claudin expression is
often highly restricted to specific regions of different tissues and may have an important role
in transcellular transport through tight junctions.
