GRIGENE Cullin 2 (CUL2) Rabbit Polyclonal Antibody – AP06078PU-S

Background:Cullin proteins comprise a distinct family of mediators that participate in the selective
targeting of proteins for ubiquitin (Ub)-mediated proteolysis. CUL-1, which is the mammalian
homolog of Cdc53 from yeast, is an integral component of the E3 ubiquitin ligase complex
designated SCF. The SCF(Skp1/CUL-1/F-box protein complex) consists of Skp1 associating
with both CUL-1 and an F-box protein, such as Skp2, which determines the substrate
specificity of the complex. CUL-1 mediated ubiquitination results in the degradation of cell
cycle proteins cyclin D, p21 and cyclin E. Another cullin, CUL-3 facilitates the degradation of
cyclin E independent of SCF activity, while CUL-2 associates with the tumor suppressing
protein VHL and elongin B to form VBC complexes, which structurally resemble the SCF ligase.
Proteolysis also occurs by way of CUL-4 associating with Nedd-8, a ubiquitin- like protein,
where it too functions as an active component of a multifunctional E3 complex. CUL-5, or
vasopressin-activated, calcium-mobilizing protein (VACM-1), is also included in the cullin
family as it shares substantial sequence homology with CUL-1.
