PORIGENE Her2 (ERBB2) Rabbit Polyclonal Antibody – AP06167PU-N

Background:The EGF receptor family comprises several related receptor tyrosine kinases that are
frequently overexpressed in a variety of carcinomas. Members of this receptor family include
EGFR (HER1), Neu (ErbB-2, HER2), ErbB-3 (HER3) and ErbB-4 (HER4), which form either
homodimers or heterodimers upon ligand binding. Neu, a glycoprotein, undergoes
transactivation upon heterodimerization with other EGF receptor family members. Neu
heterodimerization with ErbB-3 recruits heregulin, which induces phosphoinositide (PI) 3-
kinase activation. Activation of Neu potentiates tumor cell motility and protease secretion and
invasion, and also modulates cell cycle checkpoint function, DNA repair and apoptotic
responses. Amplification and/or overexpression of Neu occurs in 20-30% of breast
carcinomas. Measurement of increased Neu expression can be a predictor of disease
prognosis. Neu may also prove to be a promising arget for therapeutic agents.
