ORIGENE NFKB1 Rabbit Polyclonal Antibody – AP06245PU-M

Background:Proteins encoded by the v-Rel viral oncogene and its cellular homolog, c-Rel, are members of
a family of transcription factors that include the two subunits of the transcription factor
NFkappaB (p50 and p65) and the Drosophila maternal morphogen, dorsal. Both proteins
specifically bind to DNA sequences that are the same or slight variations of the 10 bp kappaB
sequence in the immunoglobulin kappa light chain enhancer. This same sequence is also
present in a number of other cellular and viral enhancers. The DNA binding activity of
NFkappaB is activated and NFkappaB is subsequently transported from the cytoplasm to the
nucleus in cells exposed to mitogens or growth factors. cDNAs encoding precursors for two
distinct proteins of the same size have been described, designated p105 and p100. The p105
precursor contains p50 at its N-terminus and a C-terminal region that when expressed as a
separate molecule, designated pdl, binds to p50 and regulates its activity.

Synonyms: NFKB1, KBF1, EBP-1, EBP1, NF-kappa-B p50
