SACE1 Rabbit Polyclonal Antibody – AP06371PU-M

Background:Autosomal dominant Alzheimer's disease is caused by mutations in the gene encoding the β-
amyloid protein precursor (APP). Amyloid β-peptide(Aβ), the major feature of amyloid
plaques in Alzheimer's patients, is the product of APP cleavage by β- and γ-secretases. BACE
is the transmembrane protease which cleaves Aβ from APP. BACE and the related protein
Asp1 are both widely expressed in human tissue with the highest levels in the pancreas. BACE
has a molecular mass of ~70 kDa, larger than predicted due to glycosylation, and is localized
within Golgi and endosomes.

Synonyms: BACE, KIAA1149, Beta-secretase 1, Memapsin-2, Aspartyl protease 2, ASP2, BACE-1
