CD40 Rabbit Polyclonal Antibody – AP06445PU-S

Background:Resting B cells can be activated and clonally expanded into antibody-producing cells in
response to a combination of cell contact and soluble signals provided by primed helper T
(Th) cells. While cytokines IL-4 and IL-13 alone are inadequate for B cell activation, contact
with Th cells seems to be sufficient for delivery of proliferative signals. A receptor ligand pair
central to the transmission of this signal is CD40, expressed on the surface of B cells, together
with CD40L, expressed on activated T cells. In the presence of such stimulus, IL-4 and IL-13
are capable of triggering immunoglobulin class switching and secretion of IgE. B cells are
sensitive to these cytokines only subsequent to CD40/CD40L-driven DNA synthesis. A
downstream mediator of the CD40 signaling pathway, designated CRAF, is a member of an
expanding family of proteins that contain a conserved cysteine- and histidine-rich RING finger
motif. Other members of the family include TRAF1 and TRAF2. The latter proteins have been
shown to regulate TNF-R2 as well as CD40 signaling through activation of the NFkB family of
transcription factors.
