#### **GRIGENE** CDC37 Rabbit Polyclonal Antibody – AP06781PU-N

Background:Cell cycle events are regulated by the sequential activation and deactivation of cyclin<br/>dependent kinases (Cdks) and by the proteolysis of cyclins. The cell division cycle (Cdc) genes<br/>are required at various points in the cell cycle. Cdc25A, Cdc25B and Cdc25C protein tyrosine<br/>phosphatases function as mitotic activators by dephosphorylating Cdc2 p34 on regulatory<br/>tyrosine residues. Cdc6 is the human homolog of Saccharomyces cerevisiae Cdc6, which is<br/>involved in the initiation of DNA replication. Cdc37 appears to facilitate Cdk4/cyclin D1<br/>complex formation and has been shown to form a stable complex with HSP 90. Cdc34, Cdc27<br/>and Cdc16 function as ubiquitinconjugating enzymes. Cdc34 is thought to be the structural<br/>and functional homolog of Saccharomyces cerevisiae Cdc34, which is essential for the G1 to S<br/>phase transition. Cdc16 and Cdc27 are components of the APC (anaphasepromoting<br/>complex) which ubiquitinates cyclin B, resulting in cyclin B/Cdk complex degradation.
