Background:	Trimethoprim, (5-[(3,4,5-trimethoxyphenyl)methyl]pyrimidine-2,4-diamine), is a pyrimidine inhibitor of dihydrofolate reductase and is an antibacterial related to pyrimethamine. The interference with folic acid metabolism may cause a depression of hematopoiesis. It is potentiated by sulfonamides and the trimethoprim-sulfamethoxazole combination is the form most often used. It is sometimes used alone as an antimalarial. Trimethoprim resistance has been reported.
Synonyms:	Proloprim, Trimpex, Monotrimin, Bactramin, Monotrim, Syraprim, Trimopan, Veltrim, Sulfamethoprim
