	PRDM14 (N-term) Rabbit Polyclonal Antibody – AP11206PU-N
Background:	Similar to acetylation and phosphorylation, histone methylation at the N terminal tail has emerged as an important role in regulating chromatin dynamics and gene activity. Histone methylation occurs on arginine and lysine residues and is catalyzed by two families of proteins, the protein arginine methyltransferase family and the SET domain containing methyltransferase family. Five members have been identified in the arginine methyltransferase family. About 27 are grouped into the SET domain family, and another 17 make up the PR domain family that is related to the SET domain family. PRDM14 is part of a family of PR domain genes that are involved in tumorigenesis. It may function as a transcription factor.
Synonyms:	MGC59730; PFM11

Note:

MGC59730; PFM11 Predicted MW: 64.062 kDa.

Western blot analysis of PRDM14 polyclonal antibody in A549 cell lysate. PRDM14 (arrow) was detected using purified Pab. Secondary HRP-antirabbit was used for signal visualization with chemiluminescence.

Formalin-fixed and paraffin-embedded human cancer tissue reacted with the primary antibody, which was peroxidase-conjugated to the secondary antibody, followed by DAB staining. This data demonstrates the use of this antibody for immunohistochemistry; clinical relevance has not been evaluated.
