kidney. P100 is also correlated to cancer prognosis.	to tra spi thr pu lur pla	te nuclear protein p100 is a proliferation-associated protein whose expression is restricted cell cycle phases S, G2, and M. Exclusively expressed in proliferating cells from the ansition G1/S until the end of cytokinesis. During mitosis it is strictly associated with the indle pole and with the mitotic spindle, whereas during S and G2, it is diffusely distributed roughout the nucleus. The full-length cDNA encodes a 747-amino acid protein with a itative ATP/GTP-binding site motif. RT-PCR analysis demonstrated strong expression of in ng carcinoma cell lines but not in normal lung tissues. Expression was also found in adult acenta, skeletal muscle, thymus, testis, and small intestine and in fetal brain, liver, and dney. P100 is also correlated to cancer prognosis.

The anti-p100 Pab is used in Western blot to detect p100 in placenta lysate.

Formalin-fixed and paraffin-embedded human hepatocarcinoma reacted with the primary antibody, which was peroxidase-conjugated to the secondary antibody, followed by DAB staining. This data demonstrates the use of this antibody for immunohistochemistry; clinical relevance has not been evaluated.
