RAF1 pSer339 Rabbit Polyclonal Antibody - AP12926PU-N

Background: Raf-1 is a MAP kinase kinase (MAP3K) which functions downstream of the Ras family of

membrane associated GTPases to which it binds directly. Once activated Raf-1 can

phosphorylate to activate the dual specificity protein kinases MEK1 and MEK2 which in turn phosphorylate to activate the serine/threonine specific protein kinases ERK1 and ERK2. Activated ERKs are pleiotropic effectors of cell physiology and play an important role in the control of gene expression involved in the cell division cycle, apoptosis, cell differentiation

and cell migration.

Synonyms: C-RAF, Raf-1, cRaf

Note: Molecular weight: 72921 Da
