Q9Y572

**Background:** RIPK3 is a member of the receptor-interacting protein (RIP) family of serine/threonine protein

kinases, and contains a C-terminal domain unique from other RIP family members. The

encoded protein is predominantly localized to the cytoplasm, and can undergo

nucleocytoplasmic shuttling dependent on novel nuclear localization and export signals. It is a component of the tumor necrosis factor (TNF) receptor-I signaling complex, and can induce

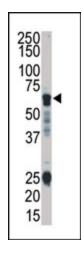

apoptosis and weakly activate the NF-kappaB transcription factor.

Synonyms: RIP-3

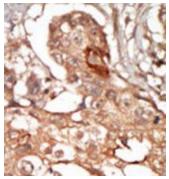

**Protein Families:** Druggable Genome, Protein Kinase

**Protein Pathways:** Cytosolic DNA-sensing pathway

Western blot analysis of anti-RIPK3 Pab in mouse cerebellum tissue lysate. RIPK3 (arrow) was detected using purified Pab. Secondary HRP-antirabbit was used for signal visualization with chemiluminescence.

Formalin-fixed and paraffin-embedded human cancer tissue reacted with the primary antibody, which was peroxidase-conjugated to the secondary antibody, followed by DAB staining.
