Background:

ALDH4A1 belongs to the aldehyde dehydrogenase family of proteins. This enzyme is a mitochondrial matrix NAD-dependent dehydrogenase which catalyzes the second step of the proline degradation pathway, converting pyrroline-5-carboxylate to glutamate. Deficiency of this enzyme is associated with type II hyperprolinemia, an autosomal recessive disorder characterized by accumulation of delta-1-pyrroline-5-carboxylate (P5C) and proline.

Synonyms:

ALDH4A1, P5CDH, P5C dehydrogenase

Western blot analysis of anti-ALDH4A1 Antibody (C-term) in HepG2 cell line lysates (35ug/lane). ALDH4A1 (arrow) was detected using the purified Pab.

Formalin-fixed and paraffin-embedded human hepatocarcinoma tissue reacted with ALDH4A1 antibody (C-term), which was peroxidase-conjugated to the secondary antibody, followed by DAB staining.
