MORIGENE HDAC3 Rabbit Polyclonal Antibody – AP20235PU-N

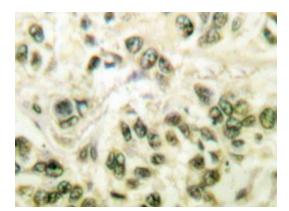

Background:	Histones play a critical role in transcriptional regulation, cell cycle progression, and developmental events. Histone acetylation/deacetylation alters chromosome structure and affects transcription factor access to DNA. The protein encoded by this gene belongs to the histone acetylase/acuc/apha family. It has histone deacetylase activity and represses transcription when tethered to a promoter. It may participate in the regulation of transcription through its binding with the zinc-finger transcription factor YY1. This protein can also down-regulate p53 function and thus modulate cell growth and apoptosis. This gene is regarded as a potential tumor suppressor gene.
Synonyms:	Histone deacetylase 3, RPD3-2, SMAP45, HD3

Protein Families: Druggable Genome, Transcription Factors
