| Background: | Glucose 6 Phosphate Dehydrogenase (G6PD) produces pentose sugars for nucleic acid synthesis and is the main producer of NADPH reducing power. Catalytic activity: D glucose 6 phosphate + NADP(+) = D glucono 1,5 lactone 6 phosphate + NADPH. Defects in G6PD are the cause of chronic non spherocytic haemolytic anemia (CNSHA). G6PD deficiency is the most common human enzyme deficiency; one benefit of having G6PD deficiency is that it confers a resistance to malaria. |
