	CHRNA10 (Center) Rabbit Polyclonal Antibody – AP50907PU-N
Background:	CHRNA10 is an ionotropic receptor with a probable role in the modulation of auditory stimuli. Agonist binding may induce an extensive change in conformation that affects all subunits and leads to opening of an ion-conducting channel across the plasma membrane. The channel is permeable to a range of divalent cations including calcium, the influx of which may activate a potassium current which hyperpolarizes the cell membrane. In the ear, this may lead to a reduction in basilar membrane motion, altering the activity of auditory nerve fibers and reducing the range of dynamic hearing. This may protect against acoustic trauma.
Synonyms:	NACHRA10, NACHR alpha-10
Protein Families	: Druggable Genome, Ion Channels: Cys-loop Receptors, Transmembrane
