	GADD45A (1-165, His-tag) Human Protein – AR09458PU-L
Summary:	This gene is a member of a group of genes whose transcript levels are increased following stressful growth arrest conditions and treatment with DNA-damaging agents. The protein encoded by this gene responds to environmental stresses by mediating activation of the p38/JNK pathway via MTK1/MEKK4 kinase. The DNA damage-induced transcription of this gene is mediated by both p53-dependent and -independent mechanisms. Alternatively spliced transcript variants encoding distinct isoforms have been found for this gene.[provided by RefSeq, Dec 2010]
Protein Families:	Druggable Genome, Stem cell - Pluripotency
Protein Pathway	s: Cell cycle, MAPK signaling pathway, p53 signaling pathway
