Image: PTP4A1 / PRL1 (1-170, His-tag) Human Protein - AR09802PU-NSummary:This gene encodes a member of a small class of prenylated protein tyrosine phosphatases
(PTPs), which contain a PTP domain and a characteristic C-terminal prenylation motif. The
encoded protein is a cell signaling molecule that plays regulatory roles in a variety of cellular
processes, including cell proliferation and migration. The protein may also be involved in
cancer development and metastasis. This tyrosine phosphatase is a nuclear protein, but may
associate with plasma membrane by means of its prenylation motif. Pseudogenes related to
this gene are located on chromosomes 1, 2, 5, 7, 11 and X. [provided by RefSeq, Jun 2013]
