	MYLPF (1-169, His-tag) Human Protein – AR39037PU-L
Summary:	Myosin regulatory light chains, including MRCL3, MYLPF and MYL9, regulate contraction in smooth muscle and non-muscle cells via phosphorylation by myosin light chain kinase (MLCK). Phosphorylation of myosin regulatory light chains, catalyzed by MLCK in the presence of calcium and calmodulin, increases the actin-activated myosin ATPase activity, thereby regulating the contractile activity. MYLPF is critically important for fast and slow skeletal muscle development.
Protein Pathwa	<b>ys:</b> Focal adhesion, Leukocyte transendothelial migration, Regulation of actin cytoskeleton, Tight junction
