	ASCC1 (1-357, His-tag) Human Protein – AR51127PU-N
Synonyms:	ASC1p50; CGI-18; p50; SMABF2
Summary:	This gene encodes a subunit of the activating signal cointegrator 1 (ASC-1) complex. The ASC- 1 complex is a transcriptional coactivator that plays an important role in gene transactivation by multiple transcription factors including activating protein 1 (AP-1), nuclear factor kappa-B (NF-kB) and serum response factor (SRF). The encoded protein contains an N-terminal KH- type RNA-binding motif which is required for AP-1 transactivation by the ASC-1 complex. Mutations in this gene are associated with Barrett esophagus and esophageal adenocarcinoma. Alternatively spliced transcripts encoding multiple isoforms have been observed for this gene.
