	Inhibin beta A chain (INHBA) (311-426, His-tag) Human Protein – AR51799PU-S
Summary:	This gene encodes a member of the TGF-beta (transforming growth factor-beta) superfamily of proteins. The encoded preproprotein is proteolytically processed to generate a subunit of the dimeric activin and inhibin protein complexes. These complexes activate and inhibit, respectively, follicle stimulating hormone secretion from the pituitary gland. The encoded protein also plays a role in eye, tooth and testis development. Elevated expression of this gene may be associated with cancer cachexia in human patients. [provided by RefSeq, Aug 2016]
Protein Families	: Druggable Genome, Secreted Protein
Protein Pathway	<b>/s:</b> Cytokine-cytokine receptor interaction, TGF-beta signaling pathway
