Background:

NT4 is a member of a family of neurotrophic factors, neurotrophins, that control survival and differentiation of mammalian neurons. The expression of NT4 is ubiquitous and less influenced by environmental signals. While knock-outs of other neurotrophins including nerve growth factor, brain-derived neurotrophic factor, and neurotrophin 3 prove lethal during early postnatal development, NT4-deficient mice only show minor cellular deficits and develop normally to adulthood.

Synonyms:

GLC10; GLC10; NT-4; NT-4/5; NT-5; NT4; NT5; NTF5

Protein Families:

Druggable Genome, Secreted Protein

Protein Pathways:

MAPK signaling pathway, Neurotrophin signaling pathway

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY NTF4 (Cat# [RC204535], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NTF4 (Cat# [TA500034]). Positive lysates [LY416817] (100ug) and [LC416817] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (10ug) from 2 different cell lines by using anti-NTF4 monoclonal antibody at 1:200 dilution.
