Serigene Ephrin A2 (EFNA2) Mouse Monoclonal Antibody [Clone ID: OTI4C3] – CF501457

Background: This gene encodes a member of the ephrin family. The protein is composed of a signal sequence, a receptor-binding region, a spacer region, and a hydrophobic region. The EPH and EPH-related receptors comprise the largest subfamily of receptor protein-tyrosine kinases and have been implicated in mediating developmental events, particularly in the nervous system. Based on their structures and sequence relationships, ephrins are divided into the ephrin-A (EFNA) class, which are anchored to the membrane by a glycosylphosphatidylinositol linkage, and the ephrin-B (EFNB) class, which are transmembrane proteins. Posttranslational modifications determine whether this protein localizes to the nucleus or the cytoplasm. [provided by RefSeq]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY EFNA2 ([RC213728], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-EFNA2. Positive lysates [LY400546] (100ug) and [LC400546] (20ug) can be purchased separately from OriGene.

Anti-EFNA2 mouse monoclonal antibody ([TA501457]) immunofluorescent staining of COS7 cells transiently transfected by pCMV6-ENTRY EFNA2 ([RC213728]).

HEK293T cells transfected with either [RC213728] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-EFNA2 antibody ([TA501457]), and then analyzed by flow cytometry.
