|                   | CD19 Mouse Monoclonal Antibody [Clone ID: OTI1F9] – CF506285  |
|-------------------|---|
| Background:       | Lymphocytes proliferate and differentiate in response to various concentrations of different<br>antigens. The ability of the B cell to respond in a specific, yet sensitive manner to the various<br>antigens is achieved with the use of low-affinity antigen receptors. This gene encodes a cell<br>surface molecule which assembles with the antigen receptor of B lymphocytes in order to<br>decrease the threshold for antigen receptor-dependent stimulation. [provided by RefSeq, Jul<br>2008] |
| Synonyms:         | B4; CVID3   |
| Protein Families: | Druggable Genome, Transmembrane   |
| Protein Pathway   | s: B cell receptor signaling pathway, Hematopoietic cell lineage, Primary immunodeficiency  |

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD19 ([RC202922], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD19. Positive lysates [LY400678] (100ug) and [LC400678] (20ug) can be purchased separately from OriGene.

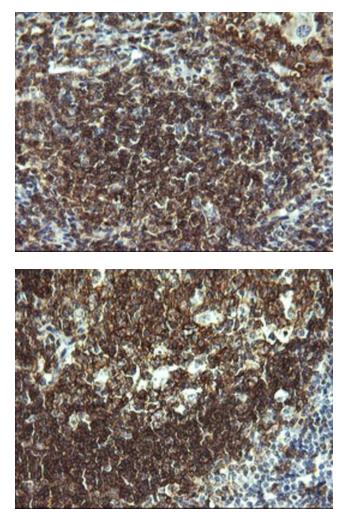

Western blot analysis of extracts (35ug) from 9 different cell lines by using anti-CD19 monoclonal antibody (HepG2: human; HeLa: human; SVT2: mouse; A549: human; COS7: monkey; Jurkat: human; MDCK: canine; PC12: rat; MCF7: human) (1:200).
