#### **CD36** Mouse Monoclonal Antibody [Clone ID: OTI1B3] – CF506366

Background:The protein encoded by this gene is the fourth major glycoprotein of the platelet surface and<br/>serves as a receptor for thrombospondin in platelets and various cell lines. Since<br/>thrombospondins are widely distributed proteins involved in a variety of adhesive processes,<br/>this protein may have important functions as a cell adhesion molecule. It binds to collagen,<br/>thrombospondin, anionic phospholipids and oxidized LDL. It directly mediates cytoadherence<br/>of Plasmodium falciparum parasitized erythrocytes and it binds long chain fatty acids and<br/>may function in the transport and/or as a regulator of fatty acid transport. Mutations in this<br/>gene cause platelet glycoprotein deficiency. Multiple alternatively spliced transcript variants<br/>encoding the same protein have been found for this gene. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD36 ([RC203254], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD36.
