Background:The protein encoded by this gene is a member of the keratin gene family. The type II<br/>cytokeratins consist of basic or neutral proteins which are arranged in pairs of heterotypic<br/>keratin chains coexpressed during differentiation of simple and stratified epithelial tissues.<br/>This type II cytokeratin is specifically expressed in the basal layer of the epidermis with family<br/>member KRT14. Mutations in these genes have been associated with a complex of diseases<br/>termed epidermolysis bullosa simplex. The type II cytokeratins are clustered in a region of<br/>chromosome 12q12-q13.
