Background:

Semaphorins represent a large family composed of 19 secreted, GPI-linked or transmembrane members divided into 5 classes (3 to 7) and characterized by the presence of a 500 amino acid Sema domain in the Nterminus. Initially described for their role in axon guidance and apoptosis during neuronal development, some semaphorins like the class 4 regulate immune functions and are involved in organogenesis and angiogenesis. The transmembrane class 6 semaphorins include 4 members (SEMA-6A to 6D). SEMA-6A features an intracellular binding site for regulatory Evi protein. In the immune system, SEMA6A protein is restricted in vitro and in vivo to an activation status of Langerhans cells. (*Gautier G et al., 2006 Am J Pathol., 168: 453-65*).
