	CD49b (ITGA2) Human Monoclonal Antibody [Clone ID: F2H11] – DDX9021A546-100
Background:	Neonatal AlloImmune Thrombocytopenia (NAIT) is the commonest cause of severe isolated thrombocytopenia in the foetus and newborn. In Caucasians, 97% of NAIT are caused by HPA- 1a or HPA- 5b alloantibodies. B4F12 was isolated after combination of CD40 activation and Epstein-Barr virus transformation of B cells isolated from a woman with high titre of anti - HPA-5b alloantibodies. B4F12 human monoclonal antibody recognizes GPIa-IIa preferentially on activated human platelets (<i>Mérieux Y, Rigal D, Pin JJ, XVIIth Regional Congress, International Society of Blood Transfusion, Madrid 2007 ; Guillot-Chene P, Lebecque S, Rigal D, Annales Pharmaceutiques Françaises, 06/2009, 67 (3) 182-6).</i>

Synonyms: human platelet antigen 5b
