> designed based on the best knowledge of CRISPR technology. The system has been functionally validated for knocking-in the cassette downstream the native promoter. The efficiency of the knock-out varies due to the nature of the biology and the complexity of the

experimental process.

Summary: The protein encoded by this gene is a subunit of the vacuolar ATPase (v-ATPase), an

heteromultimeric enzyme that is present in intracellular vesicles and in the plasma

membrane of specialized cells, and which is essential for the acidification of diverse cellular components. V-ATPase is comprised of a membrane peripheral V(1) domain for ATP

hydrolysis, and an integral membrane V(0) domain for proton translocation. The subunit encoded by this gene is a component of the V(0) domain. Mutations in this gene are a cause

of both cutis laxa type II and wrinkly skin syndrome. [provided by RefSeq, Jul 2009]
