RefSeq:	NM_001145546 , NM_033106
UniProt ID:	Q9UBC7
Synonyms:	alarin (splice variant); galanin-like peptide
Summary:	This gene encodes a member of the galanin family of neuropeptides. The encoded protein binds galanin receptors 1, 2 and 3 with the highest affinity for galanin receptor 3 and has been implicated in biological processes involving the central nervous system including hypothalamic regulation of metabolism and reproduction. A peptide encoded by a splice variant of this gene, termed alarin, has vasoactive properties, displays antimicrobial activity against <i>E. coli</i> , and may serve as a marker for neuroblastic tumors.[provided by RefSeq, Nov 2014]
