Disclaimer: These products are manufactured and supplied by OriGene under license from ERS. The kit is designed based on the best knowledge of CRISPR technology. The system has been functionally validated for knocking-in the cassette downstream the native promoter. The efficiency of the knock-out varies due to the nature of the biology and the complexity of the experimental process.

Summary: This gene encodes a transmembrane protein that is essential for the formation of adherens junctions. It is required for both the pre-implantation morphogenesis of a blastocyst and for the implantation process. The encoded protein is also a component of the ankle-link complex in cochlear hair cells, where it may effect resilience to sound trauma. It is also thought to be involved in dendritic spine morphogenesis. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Feb 2015]
