CRIGENE H2al1i (NM_001242954) Mouse Untagged Clone – MC225651	
Components:	The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).
Reconstitution Method:	 Centrifuge at 5,000xg for 5min. Carefully open the tube and add 100ul of sterile water to dissolve the DNA. Close the tube and incubate for 10 minutes at room temperature. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid at the bottom. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of shipping when stored at -20°C.
RefSeq:	<u>NM 001242954.1, NP 001229883.1</u>
RefSeq Size:	318 bp
RefSeq ORF:	318 bp
Locus ID:	100042946
UniProt ID:	<u>Q5M8Q2</u>
Cytogenetics:	X
Gene Summary:	Atypical histone H2A which can replace conventional H2A in some nucleosomes and may play a role during spermatogenesis. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.
