## Fcer2a (NM\_001253746) Mouse Untagged Clone - MC226946

**OTI Disclaimer:** Our molecular clone sequence data has been matched to the reference identifier above as a

point of reference. Note that the complete sequence of our molecular clones may differ from the sequence published for this corresponding reference, e.g., by representing an alternative

RNA splicing form or single nucleotide polymorphism (SNP).

**OTI Annotation:** Clone contains native stop codon, and expresses the complete ORF without any c-terminal

tag.

**Components:** The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

**Reconstitution Method:** 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

Cytogenetics:

Gene Summary: Low-affinity receptor for immunoglobulin E (IgE) and CR2/CD21. Has essential roles in the

regulation of IgE production and in the differentiation of B-cells (it is a B-cell-specific antigen).

[UniProtKB/Swiss-Prot Function]

Transcript Variant: This variant (6) has a different 5' end with an alternate start codon and lacks an alternate exon in the coding region, compared to variant 1. The resulting protein (isoform F) has a shorter and distinct N-terminus when it is compared to isoform A. Although variants 5 and 6 encode a protein of the same length (309 aa), the sequence of the two proteins (isoform E and isoform F) are different. Isoform F has also been called Fc epsilon receptor II subtype b variant b delta 6. Sequence Note: This RefSeq record was created from transcript and genomic sequence data to make the sequence consistent with the reference genome assembly. The genomic coordinates used for the transcript record were based on

transcript alignments.
