Gene Summary:The protein encoded by this gene is a member of the 7 transmembrane-spanning G protein-<br/>coupled receptor family, and functions as a receptor for the endogenous, opioid-related<br/>neuropeptide, nociceptin/orphanin FQ. This receptor-ligand system modulates a variety of<br/>biological functions and neurobehavior, including stress responses and anxiety behavior,<br/>learning and memory, locomotor activity, and inflammatory and immune responses.<br/>Alternatively spliced transcript variants have been described for this gene. A recent study<br/>provided evidence for translational readthrough in this gene, and expression of an additional<br/>C-terminally extended isoform via the use of an alternative in-frame translation termination<br/>codon.
