Gene Summary:This gene encodes a secreted ligand of the TGF-beta (transforming growth factor-beta)
superfamily of proteins. Ligands of this family bind various TGF-beta receptors leading to
recruitment and activation of SMAD family transcription factors that regulate gene
expression. The encoded preproprotein is proteolytically processed to generate each subunit
of the disulfide-linked homodimer. This protein may play a role in development of the
reproductive system. Mice lacking a functional copy of this gene exhibit degeneration of germ
cells and the epididymal epithelium. This gene may have arose from a gene duplication event
and its gene duplicate is also present on chromosome 4. [provided by RefSeq, Jul 2016]
