Gene Summary:This gene encodes a secreted ligand of the TGF-beta (transforming growth factor-beta)<br/>superfamily of proteins. Ligands of this family bind various TGF-beta receptors leading to<br/>recruitment and activation of SMAD family transcription factors that regulate gene<br/>expression. The encoded preproprotein is proteolytically processed to generate each subunit<br/>of the disulfide-linked homodimer. Mutation of this gene results in skeletal, kidney, and other<br/>developmental defects. [provided by RefSeq, Jul 2016]
