Gene Summary:Component of the ATAC complex, a complex with histone acetyltransferase activity on
histones H3 and H4 (By similarity). Required for the function of some acidic activation
domains, which activate transcription from a distant site (By similarity). Binds double-
stranded DNA (PubMed:16299514). Binds dinucleosomes, probably at the linker region
between neighboring nucleosomes (PubMed:16299514). Plays a role in chromatin remodeling
(By similarity). May promote TP53/p53 'Lys-321' acetylation, leading to reduced TP53 stability
and transcriptional activity (By similarity). May also promote XRCC6 acetylation thus
facilitating cell apoptosis in response to DNA damage (By similarity).[UniProtKB/Swiss-Prot
