# Product datasheet for MR208672L4V

## Osbp2 (BC058356) Mouse Tagged ORF Clone Lentiviral Particle

### **Product data:**

Lentiviral Particles
Osbp2 (BC058356) Mouse Tagged ORF Clone Lentiviral Particle
Osbp2
ORP-4, OSBPL1
Puromycin
pLenti-C-mGFP-P2A-Puro (PS100093)
mGFP
BC058356
1632 bp
The ORF insert of this clone is exactly the same as(MR208672).
The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.
<u>BC058356</u> , <u>AAH58356</u>
3281 bp
1634 bp
74309
11 A1

#### Solution Comparison Content and Comparison Content and Comparison Content and Content and

2014]

Gene Summary: The protein encoded by this gene belongs to the oxysterol-binding protein-related family of proteins, which are defined by a C-terminal sterol domain with a highly conserved EQVSHHPP motif. Oxysterols are oxygenated derivatives of cholesterol that are involved in mechanisms that include apoptosis, cholesterol homeostasis, lipid trafficking and cell differentiation. This protein is selectively expressed at high levels in the brain and testis. Within the testis, the mRNA is localized to postmeiotic germ cells, including spermatids and spermatozoa, but is not detectable in somatic cells. Mice homozygous mutant for a targeted deletion in this gene do not exhibit overt developmental phenotypes but are male sterile. Females display normal fertility. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Oct
