Gene Summary:Catalyzes the hydrolysis of sphingomyelin to form ceramide and phosphocholine. Ceramide
mediates numerous cellular functions, such as apoptosis and growth arrest, and is capable of
regulating these 2 cellular events independently. Also hydrolyzes sphingosylphosphocholine.
Regulates the cell cycle by acting as a growth suppressor in confluent cells. Acts as a
regulator of postnatal development and participates in bone and dentin mineralization.
Overexpression enhances cell death, suggesting that it may be involved in apoptosis control.
