# Product datasheet for MR211428L3V

## Top3a (NM\_009410) Mouse Tagged ORF Clone Lentiviral Particle

### **Product data:**

Product Type:	Lentiviral Particles
Product Name:	Top3a (NM_009410) Mouse Tagged ORF Clone Lentiviral Particle
Symbol:	ТорЗа
Synonyms:	MGC106383
Mammalian Cell Selection:	Puromycin
Vector:	pLenti-C-Myc-DDK-P2A-Puro (PS100092)
Tag:	Myc-DDK
ACCN:	NM_009410
ORF Size:	3009 bp
ORF Nucleotide Sequence:	The ORF insert of this clone is exactly the same as(MR211428).
OTI Disclaimer:	The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>
OTI Annotation:	This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.
RefSeq:	<u>NM 009410.2</u>
RefSeq Size:	3740 bp
RefSeq ORF:	3012 bp
Locus ID:	21975
UniProt ID:	070157
Cytogenetics:	11 B2

This product is to be used for laboratory only. Not for diagnostic or therapeutic use. ©2022 OriGene Technologies, Inc., 9620 Medical Center Drive, Ste 200, Rockville, MD 20850, US

### 

Gene Summary:Releases the supercoiling and torsional tension of DNA introduced during the DNA<br/>replication and transcription by transiently cleaving and rejoining one strand of the DNA<br/>duplex. Introduces a single-strand break via transesterification at a target site in duplex DNA.<br/>The scissile phosphodiester is attacked by the catalytic tyrosine of the enzyme, resulting in the<br/>formation of a DNA-(5'-phosphotyrosyl)-enzyme intermediate and the expulsion of a 3'-OH<br/>DNA strand. The free DNA strand then undergoes passage around the unbroken strand thus<br/>removing DNA supercoils. Finally, in the religation step, the DNA 3'-OH attacks the covalent<br/>intermediate to expel the active-site tyrosine and restore the DNA phosphodiester backbone.<br/>As an essential component of the RMI complex it is involved in chromosome separation and<br/>the processing of homologous recombination intermediates to limit DNA crossover<br/>formation in cells. Has DNA decatenation activity. It is required for mtDNA decatenation and<br/>segregation after completion of replication, in a process that does not require BLM, RMI1 and<br/>RMI2.[UniProtKB/Swiss-Prot Function]
