Gene Summary:Activates ubiquitin by first adenylating its C-terminal glycine residue with ATP, and thereafter
linking this residue to the side chain of a cysteine residue in E1, yielding a ubiquitin-E1
thioester and free AMP. Specific for ubiquitin, does not activate ubiquitin-like peptides.
Differs from UBE1 in its specificity for substrate E2 charging. Does not charge cell cycle E2s,
such as CDC34 (By similarity). Essential for embryonic development. Required for UBD/FAT10
conjugation.[UniProtKB/Swiss-Prot Function]
